PRESSURE INDEPENDENT VALVES

VPA

DN50...150, PN16

VP1000 pressure independent control valve is a combination of a differential VPA pressure independent control valve is a combination of a differential pressure regulator and a regulating valve for flow adjustment.

VPA valves offer a remarkable adjustment flexibility. In combination with VAP actuators they can be set to a specific flow rate value and they allow precise modulating control. The valves always guarantee a suitable flow rate, therefore avoiding too high energy consumption.

Since VPA valve performs the functions of two valves (balancing and adjustment), the installation costs are considerably reduced.

The automatic flow rate limitation eliminates system adjustment costs. Since adjustment is very easy to perform, design flow rates can be modified at any time and at low costs.

FEATURES

- The max. flow of VPA valve could be set according to the requirement. The flow can be set easily by the actuator potentiometer
- The built-in balancing tube has more compact structure and can avoid damages during shipping and installation compared to the external tube
- Valve body is made of ductile iron material, with anticorrosion treatment on the surface
- High close-off pressure with very low leakage rate
- Linear actuator with high control accuracy provides the equal percentage flow curve
